

I developed a prototype using Proto.io to incorporate both familiar and novel navigation elements, aiming to evaluate usability among diverse user groups. The prototype consists of four key screens: the Login Page, Home Page, Course Detail Page, and Enrollment Confirmation Page. My goal was to create a user-friendly experience while also introducing simple visual feedback techniques to enhance usability.

Familiar and Unfamiliar Navigation in UI/UX Design

Familiar Navigation

Familiar navigation refers to design elements and interaction patterns that users commonly encounter in applications and websites. These elements are intuitive, predictable, and require little to no learning curve.

Eg: Login form, buttons, list view, scroll navigation, confirmation messages.

Unfamiliar Navigation

Unfamiliar navigation includes novel, experimental, or unconventional elements that may not be immediately intuitive to users. These elements can improve usability if designed well but may require user adaptation.

Eg: Card-based course layout, visual success indicators, image-based course banners.

Familiar Navigation Elements

Traditional email and password fields for user authentication.

A Login button positioned below the input fields, which is a standard design pattern.

A scrollable course list, allowing users to browse multiple courses easily.

A clear Explore Now button to proceed with course selection.

Unfamiliar Navigation Elements

Card-style course presentation, which visually separates courses instead of using plain text lists.

Detailed course information layout combining images and text on a single screen.

Visual confirmation screen with icons to indicate successful enrollment, enhancing user feedback.
